夜間読書・キャンプに最適な赤画面ライトアプリ

White light at night hurts your eyes and ruins sleep. A red screen flashlight is gentler. Here's the best one.

Why Red Light Is Better at Night

Your eyes have two types of light receptors: cones for color vision in bright light, and rods for low-light vision. Rods are extremely sensitive to blue and white light — when exposed, they need 20-30 minutes to readjust to darkness. Red light, however, has minimal impact on rod cells, preserving your night vision.

This is why submarines, military vehicles, and astronomical observatories use red lighting at night. It is also why a red screen flashlight is vastly better than a white LED when you need light at 3 AM.

When Red Screen Light Is the Right Choice

- **Night reading** — check your phone, read a few pages, or look at a map without waking up fully.
- **Camping** — a red glow inside the tent does not blind your tent-mate or attract insects as much as white light.
- **Midnight bathroom trips** — navigate without shocking your eyes awake.
- **Checking on kids** — a soft red glow does not disturb their sleep.
- **Astronomy** — preserve dark adaptation for stargazing.

OneTap – Flashlight & SOS: Screen Light Modes

OneTap – Flashlight & SOS includes multiple screen light colors: white, warm, red, and more. Switch between LED torch and screen light with a tap. The red screen mode is designed specifically for night use.

- **Red screen light** — preserves night vision.
- **Warm light option** — less harsh than pure white.
- **Auto-off timer** — set it for bedtime use.
- **Adjustable brightness** — dim it to your comfort level.
- **No ads, no tracking, offline.**

Download OneTap for iPhone or OneTap for Android.
